 Attention Akin, Gump fax operator, please call attorney at home if there are any problems transmitting this document

The information contained in this facsimile message is attorney-client privileged and confidential, and is intended only for the use of the individual or entity named above. If the reader of this message is not the intended recipient, or the employee or agent responsible to deliver it to the intended recipient, you are hereby notified that any dissemination, distribution or copying of this communication is strictly prohibited. If you have received this communication in error, please notify us immediately by telephone, and return the original message to us by mail at the above address.

If there are any problems during this transmission, call our office at 214-969-4708.

DRAFT - SUBMITTED FOR DISCUSSION PURPOSES ONLY

1. A cable modem having a programmable media access controller, comprising:
 - a system bus;
 - a plurality of processors, each of the plurality of processors is communicatively coupled to the system bus, that perform a plurality of processing functions, the plurality of processing functions are partitioned, at least in part, between at least two of the plurality of processors;
 - a peripheral bus that is operable to perform transfer of cable media;
 - a bridge that communicatively couples the system bus and the peripheral bus; [and]
 - a peripheral processing device, communicatively coupled to the peripheral bus, that is operable to perform processing of a selectively off-loaded portion of the cable media; and
wherein one of the plurality of processors monitors a boot process for one or more of the other plurality of processors and generates a failure indicator if the boot process fails.
9. A cable modem device, comprising:
 - a bifurcated bus structure comprising a first bus and a second bus;
 - a partitioned processor structure, communicatively coupled to the first bus, comprising a plurality of processors, that is operable to perform a plurality of processing functions;
 - a co-processor, communicatively coupled to the second bus, that is operable to support processing of cable media that is selectively off-loaded from at least one of the plurality of processors;
 - an input/output interface, communicatively coupled to the second bus, that is operable to perform data transfer of a plurality of data to the second bus; [and]
a direct memory access controller that communicatively couples the first bus and the second bus and that is operable to support off-loading of at least one function of the plurality of functions to the co-processor; and

DRAFT - SUBMITTED FOR DISCUSSION PURPOSES ONLY

wherein one of the plurality of processors monitors a boot process for one or more of the other plurality of processors and generates a failure indicator if the boot process fails.

17. A method to perform processing within a cable modem, the method comprising:
performing cable media processing using a plurality of processors, the cable media processing is partitioned, at least in part, between at least two of the plurality of processors;
selectively off-loading a portion of the cable media from at least one of the plurality of processors to a co-processor; [and]
processing the off-loaded portion of the cable media using the co-processor,
monitoring with a first processor of the plurality of processors one or more boot processes for one or more of the other plurality of processors; and
generating a failure indicator if the boot process fails.
